

# Superconducting flux qubits compared to ideal two-level systems as building blocks for quantum annealers

Madita Nocon<sup>1</sup>, Dennis Willsch<sup>1</sup>, Fengping Jin<sup>1</sup>, Hans De Raedt<sup>2</sup>, Kristel Michielsen<sup>1,3</sup> <sup>1</sup> Institute for Advanced Simulation, Jülich Supercomputing Centre, Forschungszentrum Jülich, D-52425 Jülich, Germany <sup>2</sup> Zernike Institute for Advanced Materials, University of Groningen, Nijenborgh 4, NL-9747 AG Groningen, The Netherlands <sup>3</sup> RWTH Aachen University, D-52056 Aachen, Germany

## **Quantum annealing**

 $\blacktriangleright$  Preparation in known ground state of initial Hamiltonian  $H_{\rm initial}$ • Adiabatic transformation to the problem Hamiltonian  $H_{\text{final}}$ :

$$H(s) = A(s)H_{\text{initial}} + B(s)H_{\text{final}}.$$

Functions A(s) and B(s), with  $s = t/T_{\text{max}}$  and  $T_{\text{max}}$  annealing time, determine the annealing scheme and satisfy

> $A(0) > 0 \quad A(1) \approx 0$  $B(0) \approx 0 \quad B(1) > 0.$

- ▶ During the annealing process, the system stays in its ground state (if  $T_{\text{max}} \rightarrow \infty$ ; adiabatic theorem)
- ► Final state gives solution (ground state) of problem Hamiltonian
- ► Hamiltonian of quantum annealer built by D-Wave Systems Inc.:

 $H(s) = -A(s)\sum_{k} \sigma_{k}^{x} - B(s) \Big(\sum_{k} h_{k} \sigma_{k}^{z} + \sum_{l < k} J_{lk} \sigma_{k}^{z} \sigma_{l}^{z}\Big),$ 

where  $h_{k}, J_{lk} \in [-1,1]$  have to be chosen according to the problem

# Superconducting flux qubits (rf-SQUID)

- Fig. 1: Effective mutual inductance between the qubits depending on  $\varphi_{C0}^x$  from the simulation (bullets •) and the theory (line —).

#### **Comparison to the 2-level system**

- Evolution during the annealing
- the
- ► Some amount of leakage out of

Harris *et al.*, Phys. Rev. B 80, 052506, 2009

- $H_{\rm int} = (M/L_{\rm eff})E_L(\varphi_1 \varphi_1^x)(\varphi_0 \varphi_0^x) + (M/L_{\rm eff})E_L(\varphi_2 \varphi_2^x)(\varphi_0 \varphi_0^x)$  $+ (M^2/L_a L_{eff}) E_L(\varphi_1 - \varphi_1^x)(\varphi_2 - \varphi_2^x)$
- ▶ external fluxes  $\varphi_{C_i}^x(s)$  and  $\varphi_i^x(s)$  determine A(s)and B(s) for the qubits
- $\varphi_i^x(s)$  depend on the parameters of the problem Hamiltonian
- $\triangleright \varphi_{C_i}^x$  gives a tunable Josephson-Junction
- Qubit: changes potential for  $\varphi_i$  (which defines qubit states) from monostable to bistable
- $\blacktriangleright$  Coupler: leads to tunable coupling constant J

Qubit 1 Coupler Qubit 2  $\varphi_0$  $arphi_2$  $\varphi_{\mathrm{C1}}^{x}$  3  $\chi^{\varphi}_{\mathrm{C1}}$  $arphi_{\mathrm{C2}}$  $( \begin{array}{c} & \\ \varphi_1^x \\ & \end{pmatrix} \rightarrow h_1$  $( \varphi_2^x ) \to h_2$  $\varphi^x_{\mathrm{CO}}$ 

#### Suzuki-Trotter product-formula algorithm

De Raedt, Comp. Phys. Rep. 7, 1, 1987

▶ Numerically solving the time-dependent Schrödinger equation

 $i\partial_t |\psi(t)\rangle = H(t)|\psi(t)\rangle$ 

► Hamiltonian is discretized in time State vector  $|\psi(t)\rangle$  is updated for each time step  $\tau$ 

 $|\psi(t+ au)
angle=e^{-iH_{t+ au/2} au}|\psi(t)
angle$ 

- If  $\tau$  sufficiently small, time-evolution operator  $e^{-iH_t\tau}$  is well approximated by  $e^{-iH_t\tau} = e^{-i\sum_k A_{k,t}\tau} \approx \prod_k e^{-iA_{k,t}\tau}$
- Decomposition  $H_t = \sum_k A_{kt}$  ideally chosen such that exponentials are performed in two-component updates of  $|\psi(t)\rangle$

### Conclusion

for the ideal 2-level system (bullets  $\bullet$ ) and flux qubits (circles  $\bigcirc$ ).

- ▶ By using the Suzuki-Trotter product-formula algorithm, we could simulate the dynamics of the full system and compare it to the 2-level system as well as to the analytical calculation including approximations.
- ▶ For the investigated case, the simulation results of the effective coupling agree with the theory and the experiment. Thus, the analytical approximations can be justified, and the experimental setup can be sufficiently described by this Hamiltonian.
- ► We find deviations during the evolution and the final probabilities between the flux qubits and the 2-level system. However, these are rather small and not surprising due to the approximations made.
